Orecast

Mineral intelligence over time

Mineral evidence, changing conditions and time to exit belong in the same decision.

Our prototype investigates an assumed mineral option
and tests whether it can produce cash within the time available.

Timelines are illustrative. The holding period and closing buffer must fit before expiry.

We begin with

67

measured sediment samples from Tok River, Alaska.

A has 33 samples. B has 34.
Primary gold assays screen the evidence.

Recoverable ounces remain a separate assumption.

The evidence explorer

Orecast

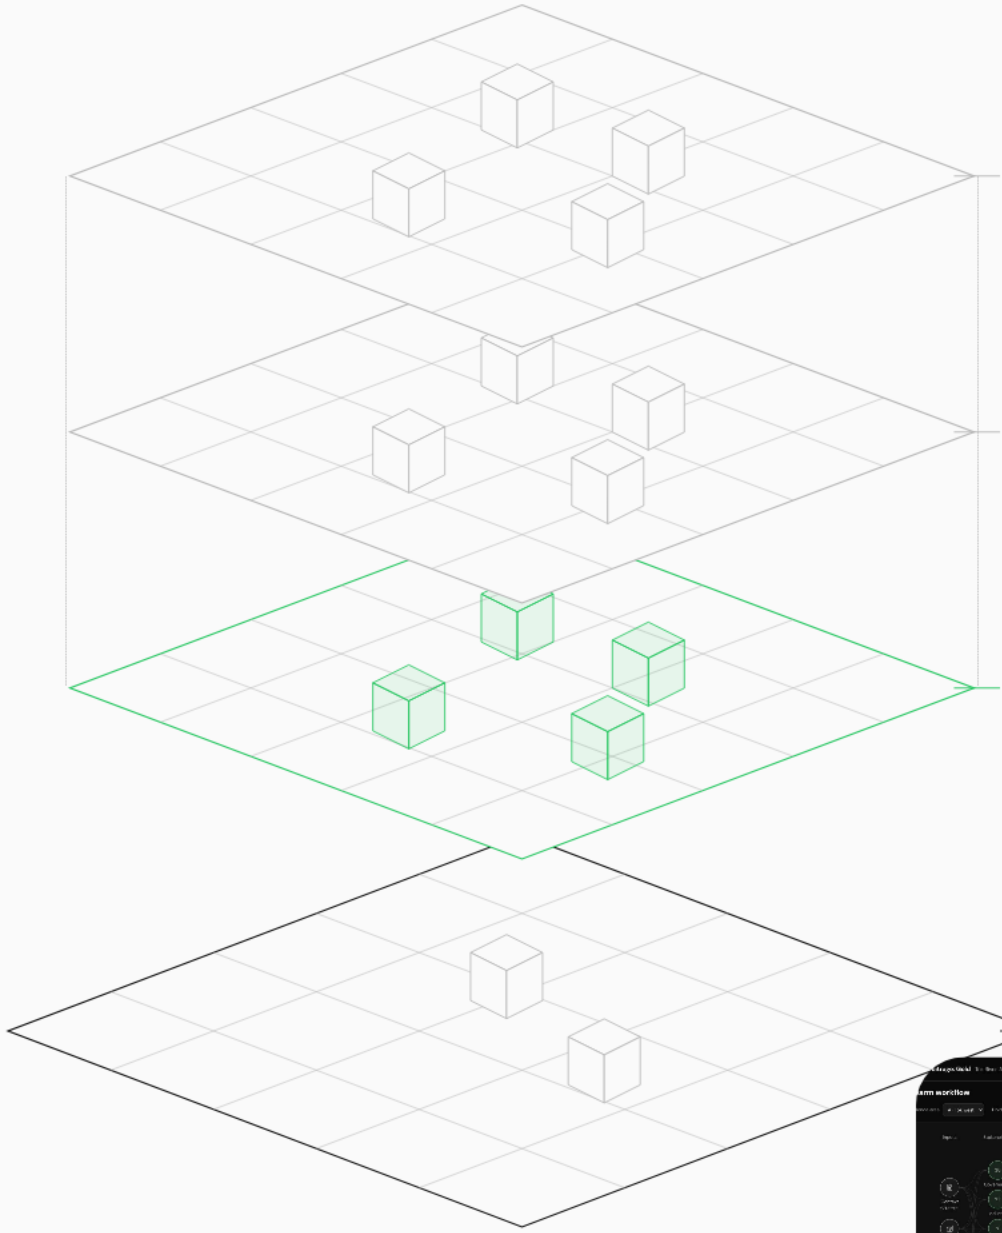

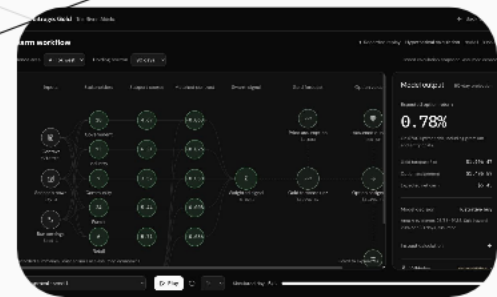

Alaska DGGS RDF 2016-10. Comparison areas, not available listings.

Orecast adjusts the gold forecast, then recomputes mineral and interest value, assignment and cash.

Observed assays screen evidence.
Recorded support informs a scenario.
Gold response and economics are assumed.

Recorded support changes an assumed gold forecast, then flows through to the same option contract.

Mine approval

–0.0252 support · $1,996.47/oz gold

$5.45 expected cash · 0.78% option return

Court blockage

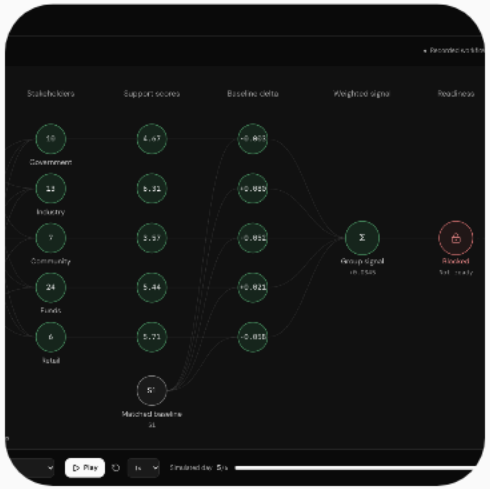

+0.0307 support · $2,004.30/oz gold

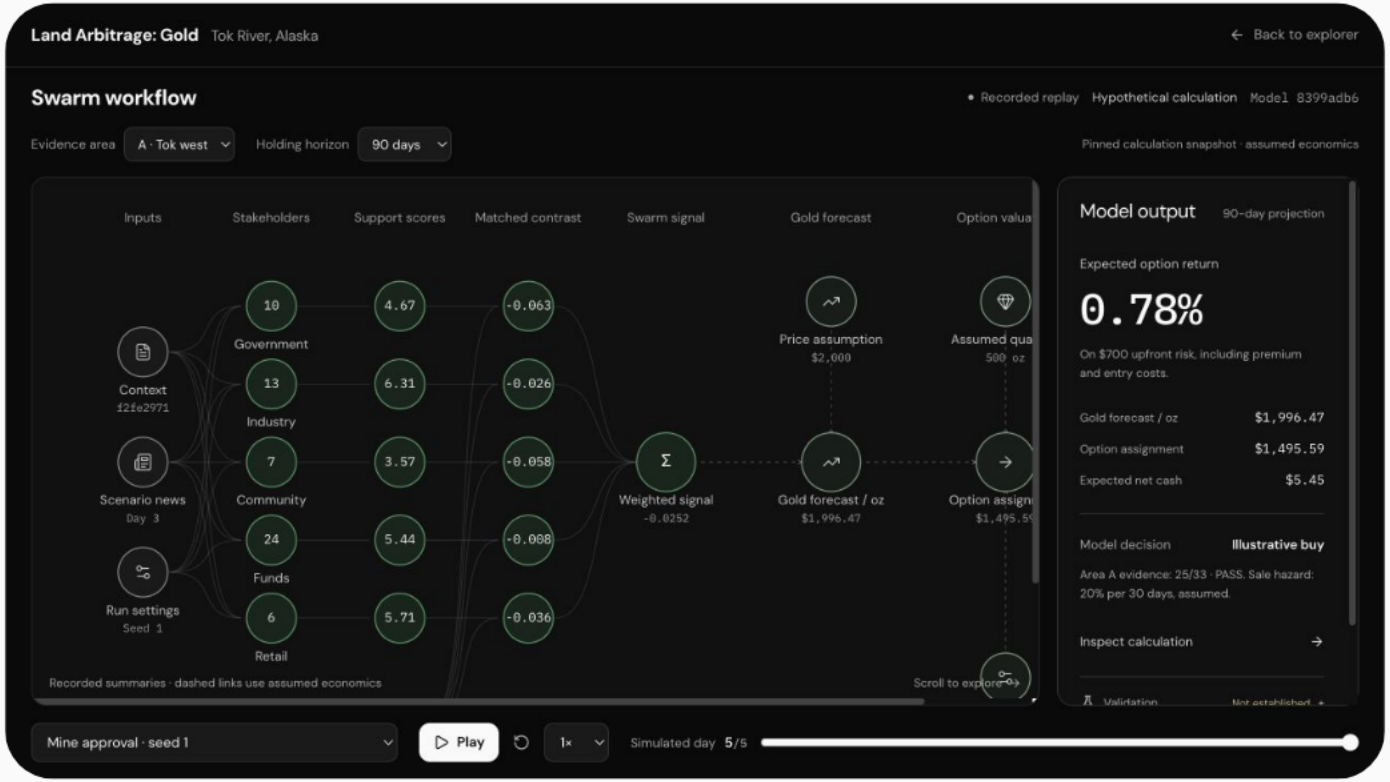

$10.22 expected cash · 1.46% option return

7% assumed gold response cap. Financial outputs hypothetical. Research checks failed.

Matching sports-placebo reference, days 3–5.
Support scale –1 to +1. Area A, 90 days.

At 90 days, the same hypothetical option has

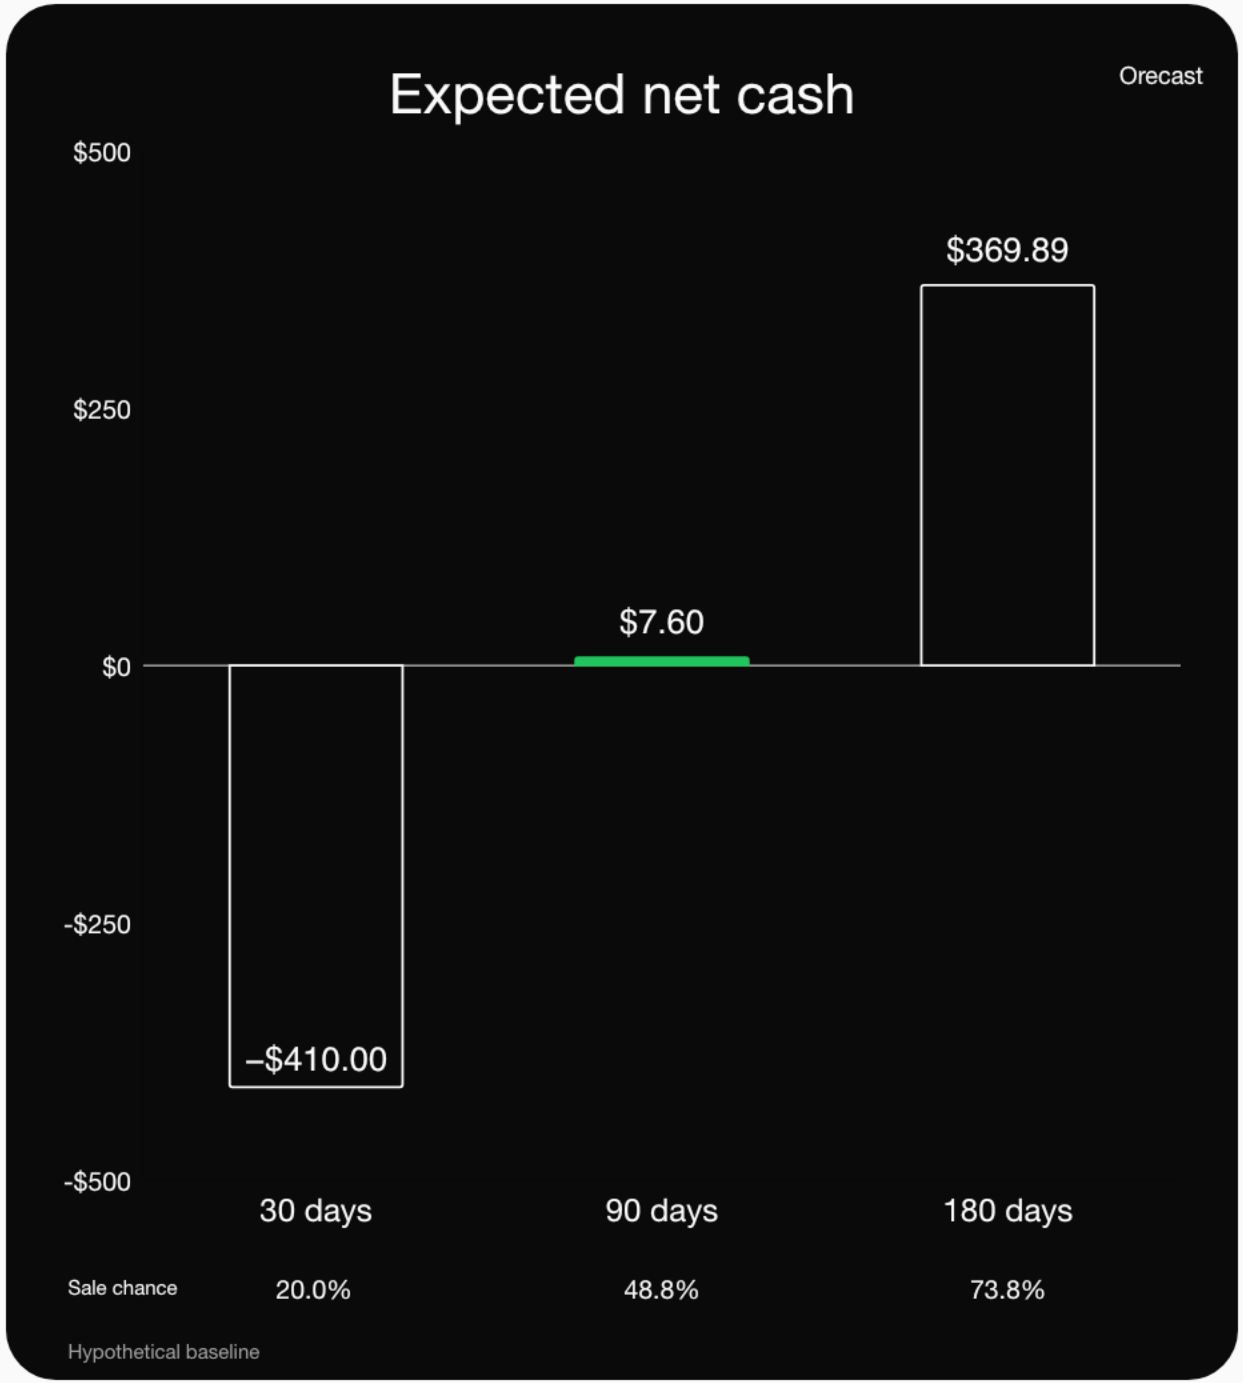

1.09%

expected option return, while

51.2%

of paths have no sale.

$700 upfront. No-sale cash: –$700. Zero gold growth.
20% assumed sale hazard per 30 days; gold stays $2,000/oz.
Non-annualized option return = expected cash / $700.

Inspect how evidence, a scenario and time affect a mineral decision.

Compare the trace. Then test it against completed assignments and unsold cases.

Live demonstration

Financial outputs are hypothetical.
The pilot event adjustment did not beat baseline.

Imagery: Esri, Maxar, Earthstar Geographics. Terrain: Mapzen.

Baseline cash and option return at 90 days

Hypothetical cash branches after all entry and exit costs. All amounts USD.

Outcome by day 90	Probability	Net cash	Weighted cash
Sale	48.8%	+$750.00	+$366.00
No sale	51.2%	–$700.00	–$358.40
Expected net cash	**100.0%**		**+$7.60**

$$0.488 \times \$750 + 0.512 \times (-\$700) = \$7.60$$

Expected option return: $7.60 / $700 = 1.09%, non-annualized.

Median cash: –$700. Break-even premium: $657.60.
A $660 premium changes expected cash to –$2.40 and the decision to skip.

Historical pilot: the event adjustment did not beat baseline

12 selected equity events. Five held-out observations per horizon, in distinct cohorts. Lower MAE is better.

Model	5-session MAE (pp)	20-session MAE (pp)
No change	2.5562	5.9474
Gold-only	3.1291	7.5670
Gold + event	8.0596	14.3108

Retrospective equity component test, not Tok option returns.

Event adjustment did not beat baseline.
No paired historical swarm outcomes.

Next: paired prospective outcomes and calibrated assignment liquidity.
