Orecast

Mineral intelligence over time

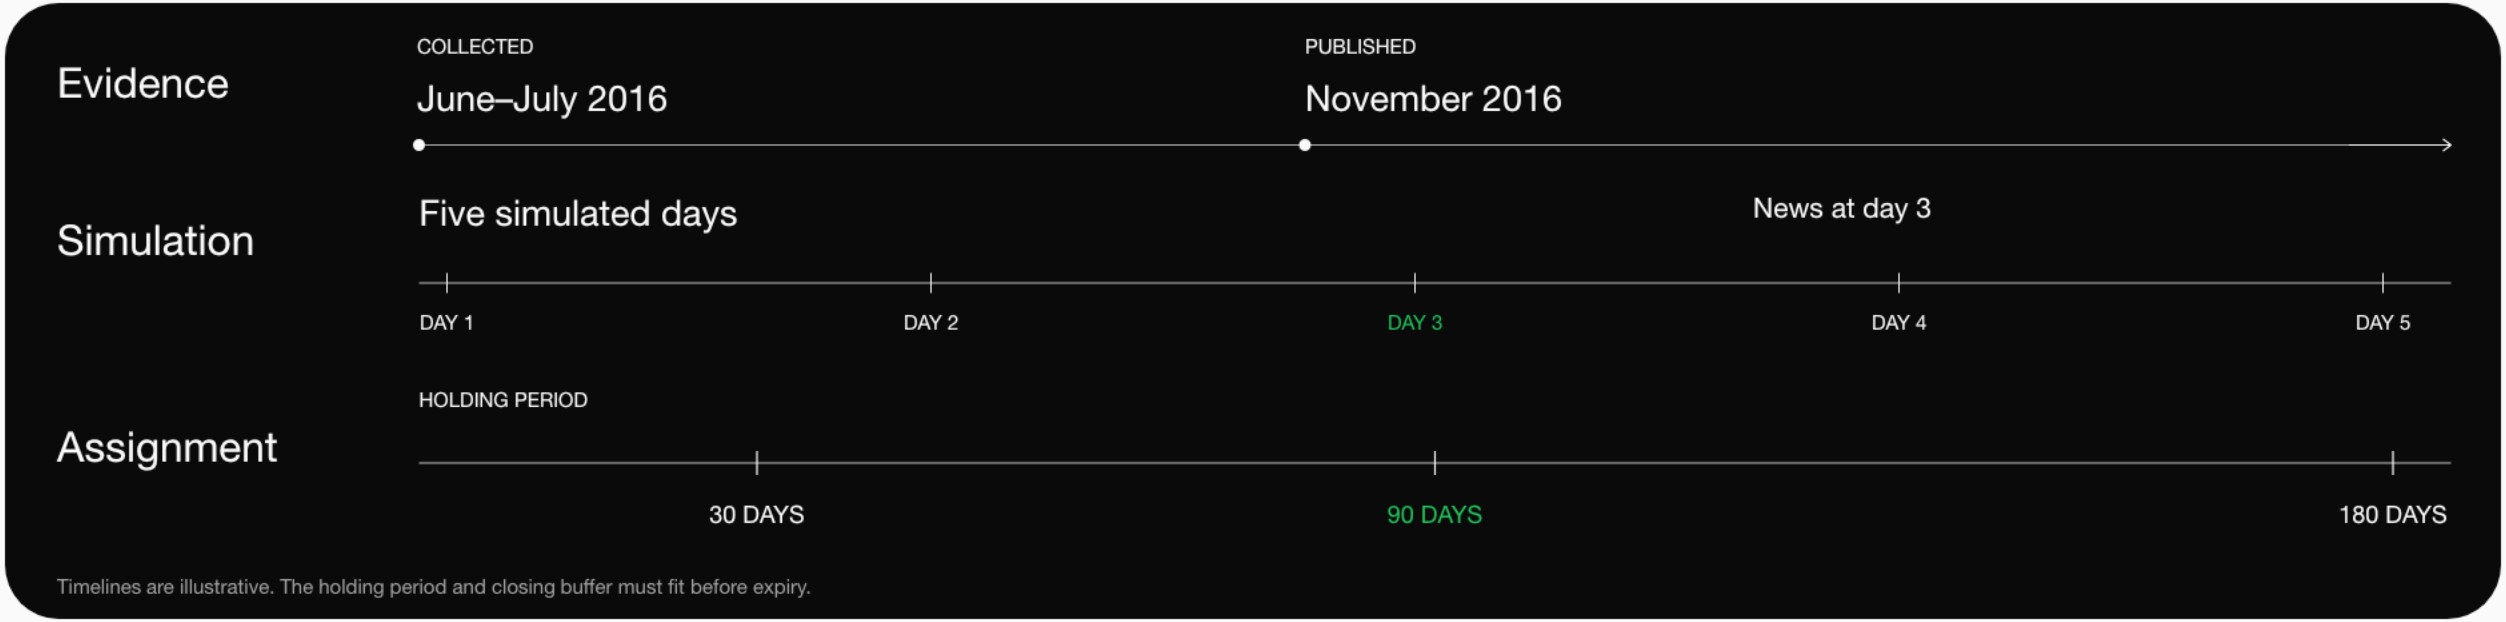

Mineral evidence, changing conditions and time to exit belong in the same decision.

A $30,000 historical signing-payment reference becomes a $30,050 assumed whole-lot entry.

Two selected historical payments, not a current quote or full contract cost.

Assumed fund $1,502,500 · $30,050 per lot · $150,250 open / lifetime · 5 positions

Timelines are illustrative. The holding period and closing buffer must fit before expiry.

We begin with

67

measured sediment samples from Tok River, Alaska.

A has 33 samples. B has 34.
Primary gold assays screen the evidence.

Recoverable ounces remain a separate assumption.

The evidence explorer

Orecast

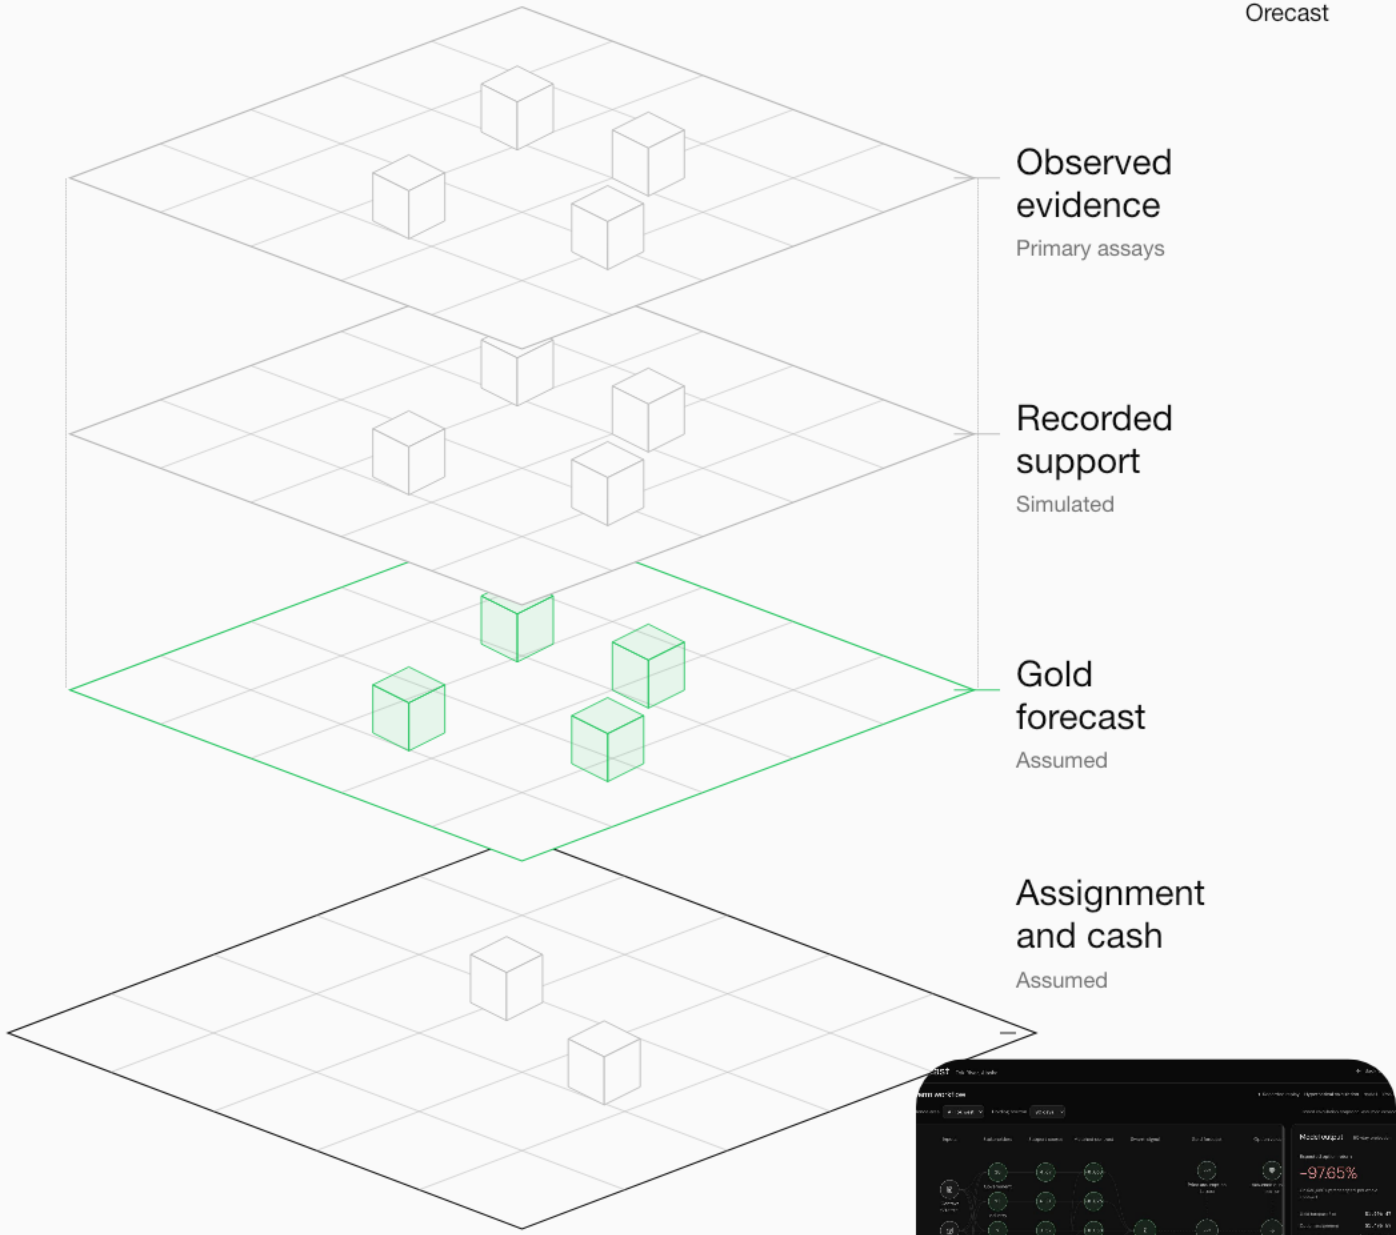

Alaska DGGS RDF 2016-10. Comparison areas, not available listings.

Orecast adjusts the gold forecast, then recomputes mineral and interest value, assignment and cash.

Observed assays screen evidence.
Recorded support informs a scenario.
Gold response and economics are assumed.

Recorded support changes an assumed gold forecast. Both whole-lot scenarios still fail the cash test.

Mine approval · SKIP

–0.0252 support · $1,996.47/oz gold

–$29,344.55 cash · –97.65% return

Court blockage · SKIP

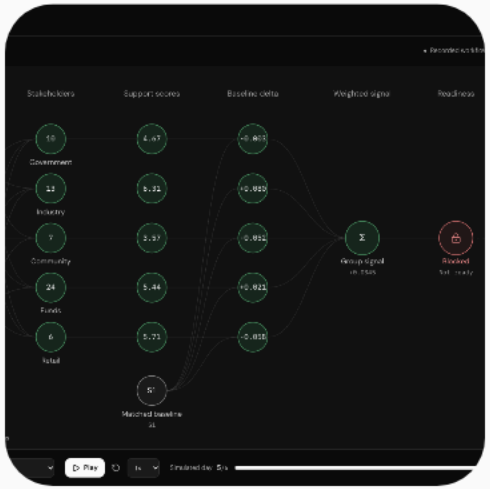

+0.0307 support · $2,004.30/oz gold

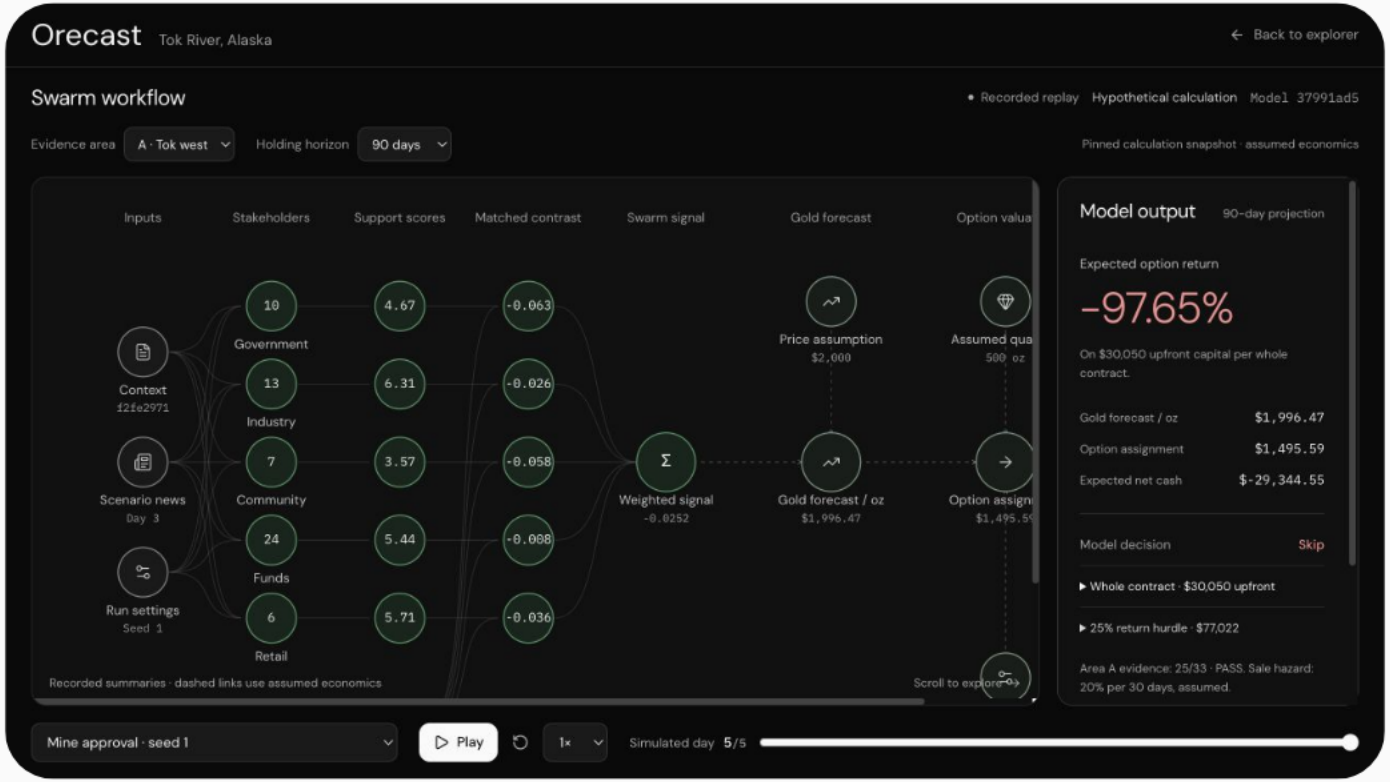

–$29,339.78 cash · –97.64% return

7% assumed gold response cap. Financial outputs hypothetical. Research checks failed.

Matching sports-placebo reference, days 3–5.
Support scale –1 to +1. Area A, 90 days.

At $30,050 upfront,
the 90-day baseline has

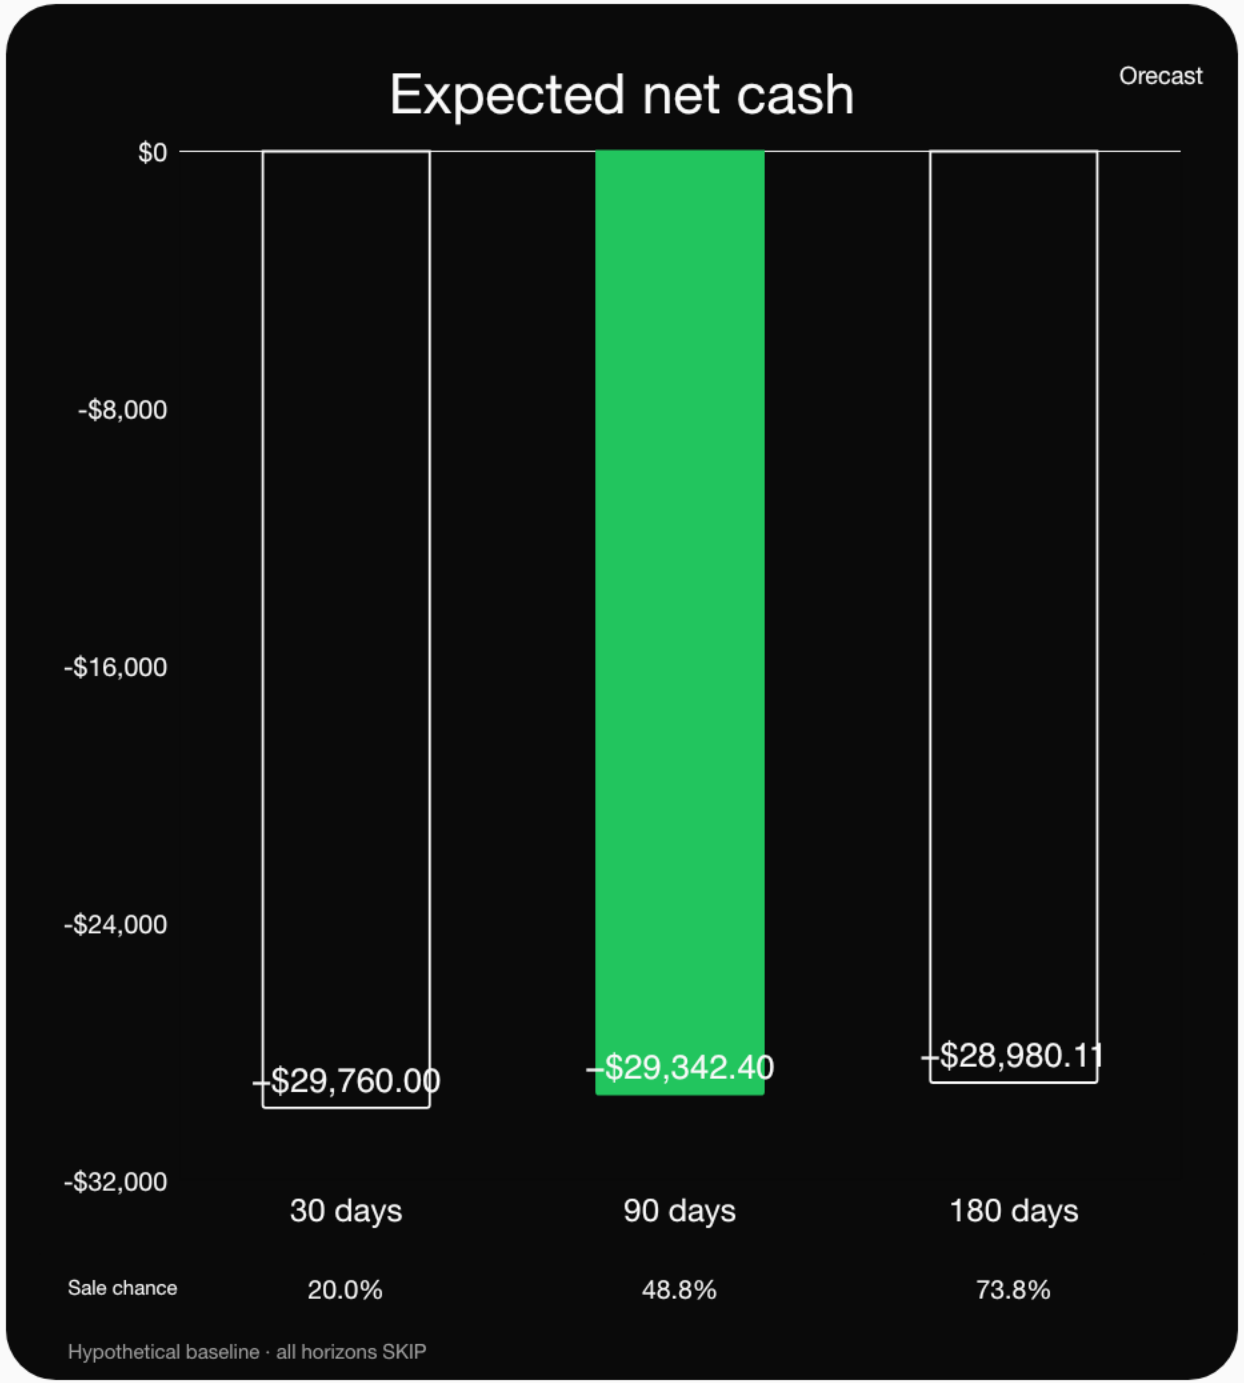

−97.65%

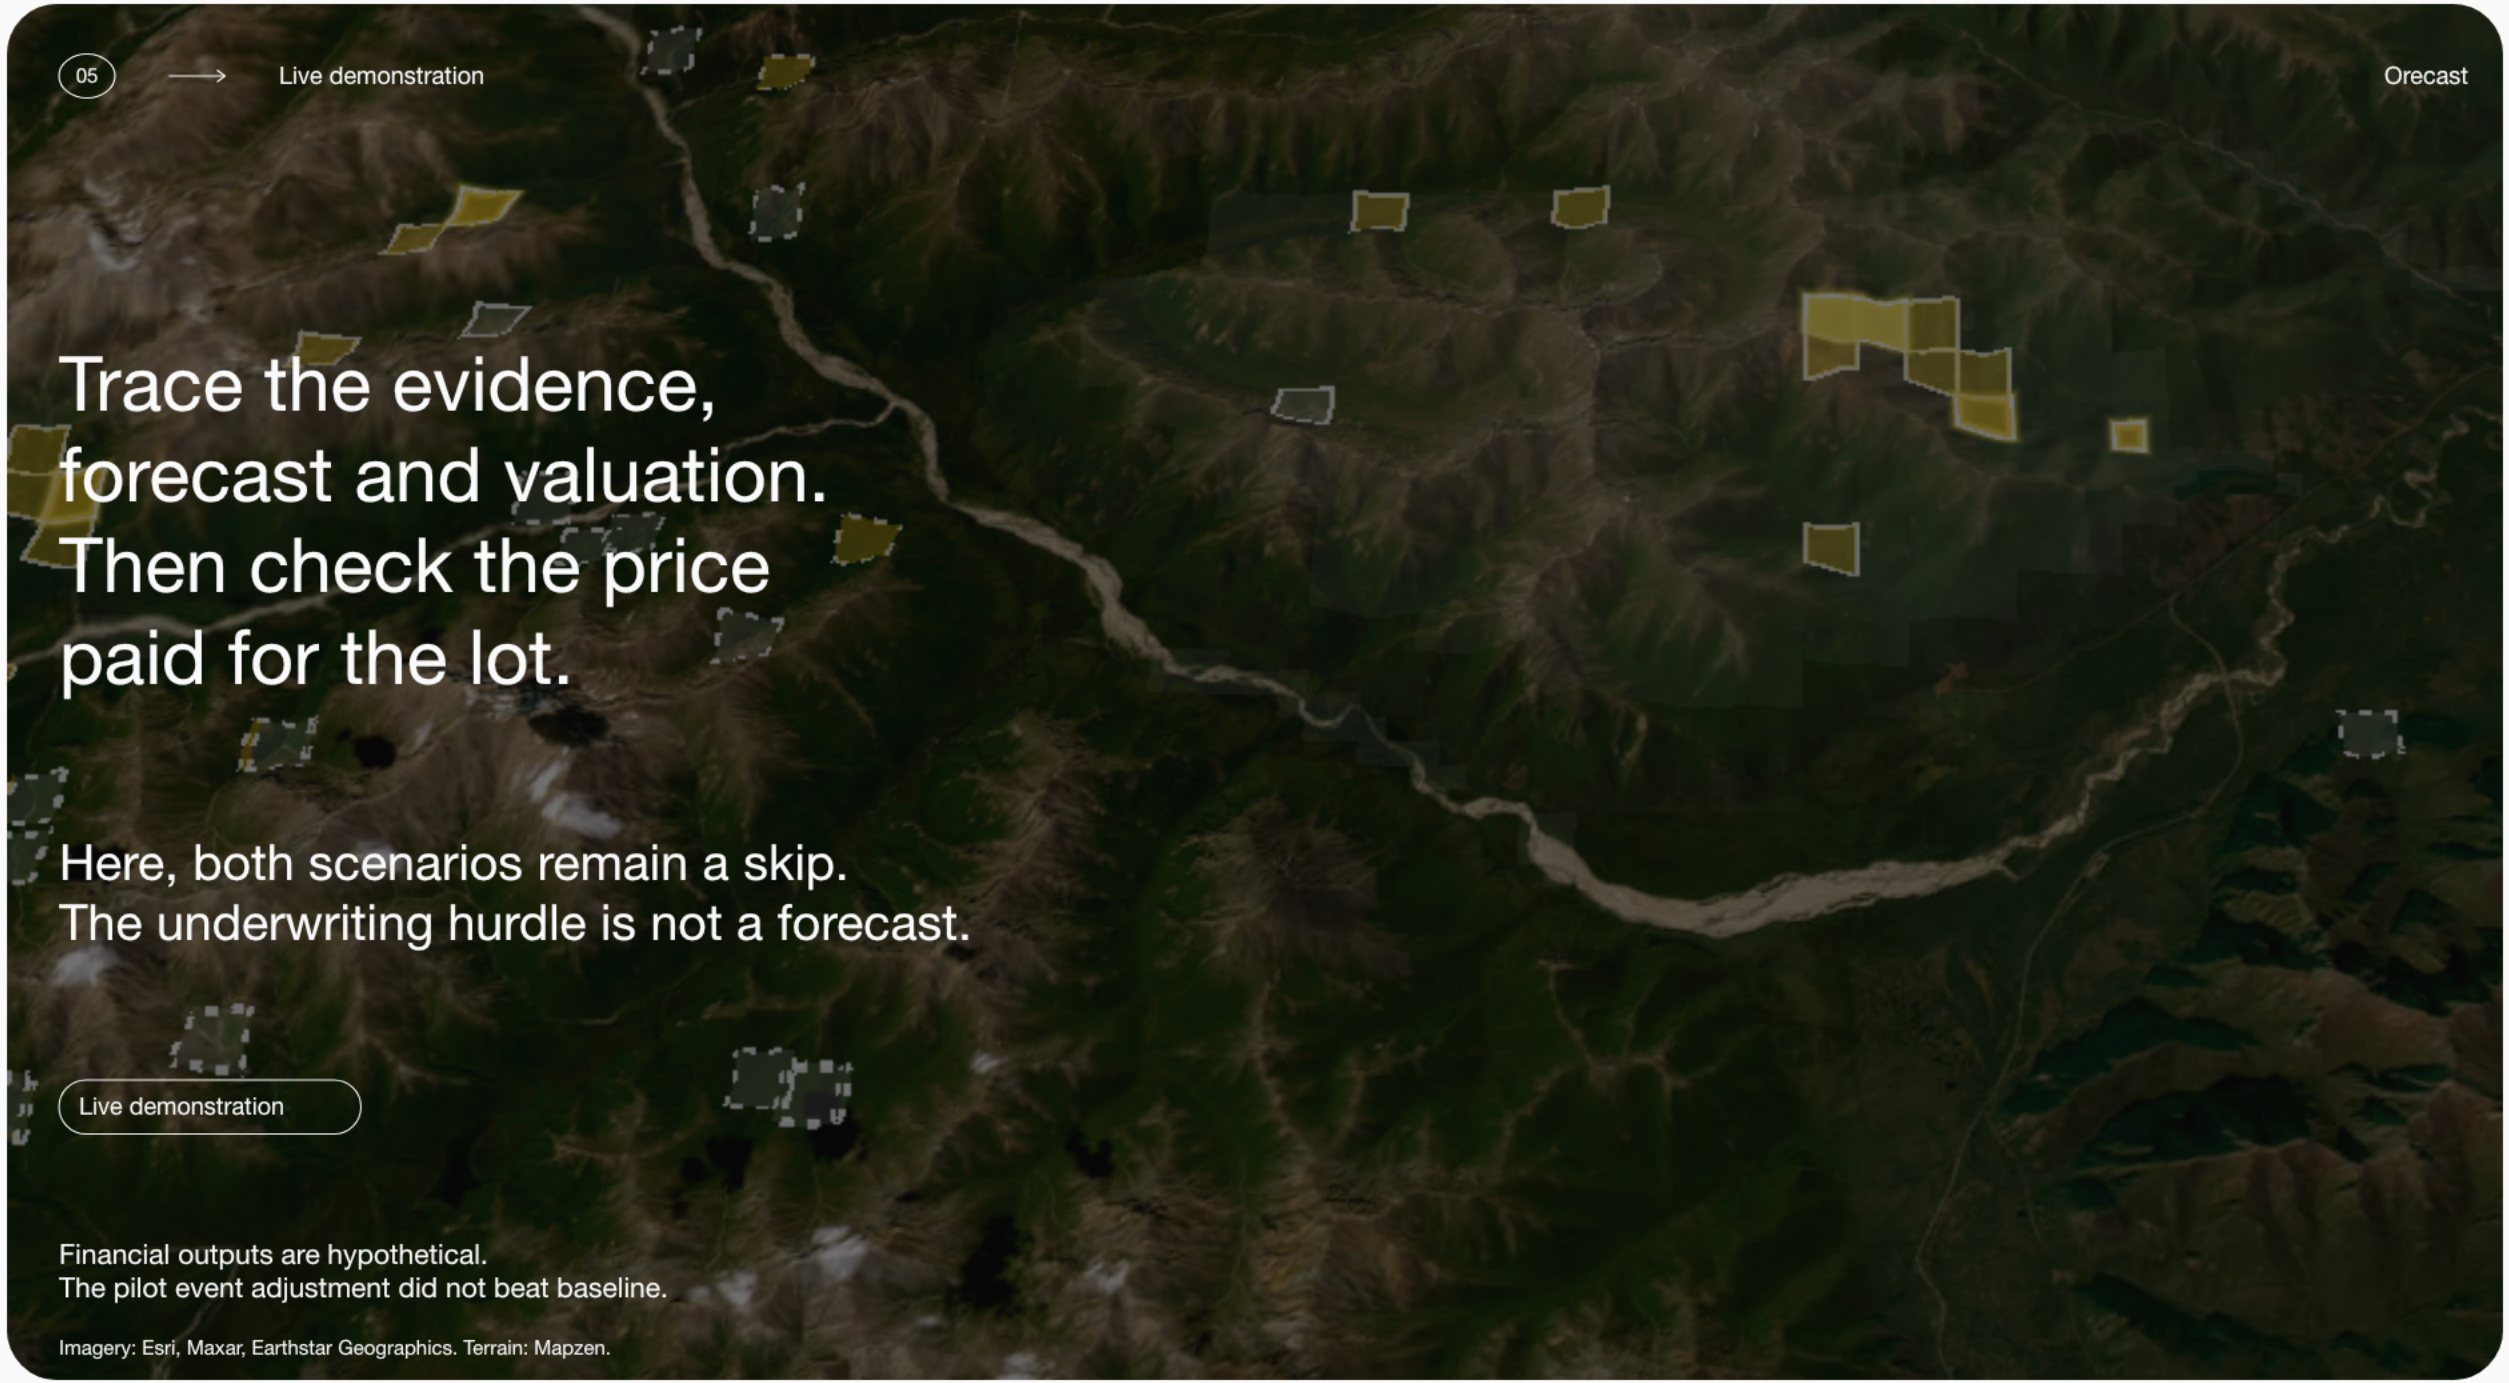

expected option return.

SKIP

The cash test rejects entry.

Model assignment: $1,500. No-sale cash: −$30,050.
25% return needs $77,022.34 resale. A hurdle, not a forecast.
20% assumed sale hazard per 30 days. Zero gold growth.

Trace the evidence, forecast and valuation. Then check the price paid for the lot.

Here, both scenarios remain a skip.
The underwriting hurdle is not a forecast.

Live demonstration

Financial outputs are hypothetical.
The pilot event adjustment did not beat baseline.

Imagery: Esri, Maxar, Earthstar Geographics. Terrain: Mapzen.

Baseline cash and option return at 90 days

Hypothetical cash branches after all entry and exit costs. All amounts USD.

Outcome by day 90	Probability	Net cash	Weighted cash
Sale	48.8%	–$28,600.00	–$13,956.80
No sale	51.2%	–$30,050.00	–$15,385.60
Expected net cash	**100.0%**		**–$29,342.40**

$$0.488 \times (\$1{,}500 - \$50) - \$30{,}050 = -\$29{,}342.40$$

Expected option return: –97.65%, non-annualized. Decision: SKIP.

For a 25% expected return, required conditional resale is $77,022.34.
This is an underwriting hurdle, not a forecast. Model assignment remains $1,500.

Historical pilot: the event adjustment did not beat baseline

12 selected equity events. Five held-out observations per horizon, in distinct cohorts. Lower MAE is better.

Model	5-session MAE (pp)	20-session MAE (pp)
No change	2.5562	5.9474
Gold-only	3.1291	7.5670
Gold + event	8.0596	14.3108

Retrospective equity component test, not Tok option returns.

Event adjustment did not beat baseline.
No paired historical swarm outcomes.

Next: paired prospective outcomes and calibrated assignment liquidity.
